Details

They correct the caster angle that changes after the car lift. The correction of the caster is considered necessary, because it is directly related to the behavior of the front suspension system and driving safety.

They also help to properly sitting the springs, correct cross shaft angles and to lower the stress on the shock absorber mounts.

The main element is made of a special alloy and the geometry of their design is such that they allow their flexible rotation, excluding permanent deformations and creation of dangerous cracks on them, as well as on the axles and chassis mounts.

The silent blocks we propose to use are that of the Suzuki OEM.

We have the ability to create them for front or/and back and for heights from +4 cm to +12 cm.

They are delivered painted black matte.

Units in box: 2 pcs
